

Yellow Cedar

Characteristics

Yellow Cedar is valued for its strength, extreme durability and outstanding beauty. It is renowned for its distinctive, uniform yellow colour, fine texture and straight grain. Because it is considerably harder than most commercial softwoods, it has excellent strength and wear properties. The old-growth version of this resistant wood has so much more heartwood than its new or second-growth cousins that it is harder and has much greater resistance to rot and insects. Yellow Cedar which has many different names such as Alaskan Yellow Cedar and Sitka Cypress is a much harder wood than Western Red Cedar.

Benefits

- Excellent resistance to decay and insect attack
- Useful for environmentally sensitive purposes when chemically treated wood is not suitable
- Good impact resistance
- Shows little shrinkage
- Holds nails and screws without splitting and can be glued without difficulty
- Contains natural preservatives called tannins, giving them great durability, they repel against moisture, insects, and decay.

Uses

- Patio decking
- Fresh or salt water docks
- Landscaping
- Stairs
- Doors
- Decorative panelling
- Boat building
- Oars and paddles
- Carvings
- Water reservoirs
- Marine pilings
